

SQData Introduces XPDR Extreme-Performance Data Replicator for DB2 z/OS

The Fastest, Most Efficient Data Replication Solution Available for DB2

Addison, Texas, February 3rd, 2014 -- SQData Corporation, a leading provider of enterprise-class data replication software, announced today SQData's Extreme-Performance Data Replicator (XPDR) feature for DB2 z/OS. Designed for customers with big data and high transaction volumes, XPDR provides the power and reliability required for critical data replication processes.

Performance and efficiency are leveraged via SQData's auto-map technology and high-performance changed data capture framework, resulting in low latency, rapid throughput. XPDR has a proven track record of outperforming other DB2 replication products in overall speed, lower CPU consumption and the time required for deployment.

“Companies are always on the lookout for data replication solutions that 1) don't require other products in order to run, 2) don't dim the lights when you fire them up and 3) don't cost a fortune to acquire or operate. Looking at the marketplace, we determined that there were not a lot of viable replication solutions that met this criteria. Adding XPDR into our data replication product suite was a no brainer.” said Scott Quillicy, CEO and Founder of SQData.

Highlights:

- Designed for maximum throughput of high DB2 z/OS transaction volume
- Supports DB2 and non-DB2 databases on both mainframe and distributed platforms
- Highly scalable and configurable
- Ideal for active/active or active/passive continuous availability setups
- Includes near-real-time XML event publishing, data integration and data warehouse population
- Rapid setup and deployment
- More efficient CPU utilization than other commercial data replication products
- Real-time performance metrics and alerts

SQData XPDR for DB2 z/OS is available immediately with SQData version 3.9.

About SQData

SQData specializes in high-performance, enterprise-class data replication software for relational and non-relational database on both mainframe and distributed platforms. SQData allows customers to address multiple business needs including data replication, near-real-time population of data warehouses, business event publishing and data conversions/migrations.
